

Abstract

[Problem]

To provide a drive circuit (driver IC) of an organic EL display panel and an organic EL display device, which is capable of shortening a test time when a test on appropriateness of current values outputted to respective column pins of the drive circuit.

[Means for Solving the Problem]

Output currents outputted from respective output terminals of a drive circuit (driver IC) of an organic EL display panel to respective column pins or data lines are sequentially selected by sequentially scanning a plurality of switch circuits by a switch scan circuit, the output currents are converted into voltage values by resistors selected by a selector and the converted voltage values sequentially generated according to the scanning of the switch scan circuit are outputted externally of the IC.
